# WEEKLY HEALTH REPORT

## NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, Forms 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

### MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

### STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having a strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

### HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds currently reported as "expansion beds" and beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in this report.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. Where the hospital has convalescent facilities, the letters (CF) appear after its name. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

### EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where part or all of the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

## WEEKLY HEALTH REPORT

WEEK ENDING 25 DECEMBER 1943

## COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES AS A WHOLE

As indicated in the chart on page 3, the admission rate from colds, influenza, etc. declined for the second consecutive week for the United States as a whole and was reported at 521 per thousand per year for the week ending 25 December. This rate was 17% below the peak rate registered two weeks earlier. Morbidity from colds, influenza, etc. continued downward in all Service Commands, except the Fourth and the Eighth which after reporting relatively low rates during the week ending 18 December showed moderate increases during the Xmas week. Morbidity from colds, influenza, etc. for the week ending 25 December 1943 was approximately 10 percent higher than for the corresponding week of 1942. Morbidity from all forms of pneumonia during the week ending 25 December continued substantially the same as for the preceding week and about 15 percent lower than for the corresponding week of 1942.

Lower rates of admission from all causes and from all diseases combined were reported for the week ending 25 December 1943, reflecting partly the decline in morbidity from colds, influenza, etc. and partly the lessened morbidity from other causes in anticipation of Xmas leaves. The all causes rate at nearly 950 per thousand per year and the corresponding all diseases rate of nearly 890 per thousand per year were both practically the same as for the corresponding week in 1942.

Also probably on account of the Xmas holidays, the admission rate from injury for the week ending 25 December dropped to 61 per thousand which was not only the lowest point recorded in 1943 but in all likelihood the lowest rate ever reported.

The mean number of non-effectives which had in recent weeks risen to the very high level of 44 per thousand, as a result of the influenza epidemic, declined to 41 per thousand for the week ending 25 December. This decrease occurred in all Service Commands except the Fifth, while in the Fourth and the Eighth the non-effective rate remained about the same despite higher morbidity from colds, influenza, etc. Most of the decline in the non-effective rate for the country as a whole was due to the increasing numbers of influenza cases being returned to duty, but the practice during the Xmas season of discharging from hospital and granting short-term leaves to the less seriously ill patients was also an important factor.

VARIATIONS IN MORBIDITY BY SERVICE COMMANDS

As mentioned above, only the Fourth and Eighth Service Commands registered higher morbidity from colds, influenza, etc. for the week ending 25 December 1943. In the Fourth Service Command (where morbidity from colds, influenza, etc. had declined the previous week) this week's admission rate increased to nearly 530 per thousand per year or practically the same as it had been two weeks earlier and still below the point of previous high morbidity from these causes reached in January 1943. In the Eighth Service Command the admission rate increased to over 580 per thousand per year, which was also below the point of previous high morbidity reported in January 1943.

The Second Service Command and the Military District of Washington, which showed the highest rates of admission from colds and influenza during the week ending 18 December, experienced the largest decreases in morbidity from these causes during the week ending 25 December. The Second Service Command with an admission rate of 594 per thousand per year reported the highest morbidity from these causes during the week ending 25 December and was closely followed in this respect by the Eighth Service Command. The Sixth Service Command in which a peak rate of admission (of nearly 1280 per thousand) had been reached in the week ending 4 December reported the lowest morbidity (of less than 350 per thousand) for the week ending 25 December.

Due to their relatively high morbidity from colds, influenza, etc. the Second and the Eighth Service Commands were the only ones to report morbidity from all causes in excess of 1000 per thousand per year.

CURRENT HOSPITALIZATION CONDITIONS

The total bed capacity decreased slightly during the week to approximately 355,000 on 25 December 1943. However, the beds occupied decreased by nearly 30,000 to just over 169,000 and the number of "available vacant" beds increased correspondingly to over 115,000. This is the lowest number of beds occupied since July 1943 and probably the highest number of "available vacant" beds ever on hand. The very large decrease in the number of beds occupied reflects not only the waning of the influenza epidemic and the customary discharges from hospital at Xmas-time but also the very much increased granting of convalescent leaves and furloughs at this time of the year. On 25 December there were only 20 stations with a bed capacity of about 11,000 which had no "available vacant" beds; among them were 6 general hospitals with a bed capacity of 8,400 beds.

On 25 December there were 1968 cases of malaria remaining under treatment, all but 19 of which had presumably been acquired outside of the United States. The number of neuropsychiatric cases remaining under treatment at the end of the week was reported at 15,638.
